

Notes: Old/new interface (12/10 @75cm) produced SP fractures and inconsistent propagation. 12/10 was the culprit in recent small (D1.5) human triggered avalanches in the hwy 542 corridor on northerly aspects above 5500ft. 12/10 is rounding and gaining strength. 11/23 (@50cm) is moist, rounding, and not an issue.
