

Andacite Peak
 Sierra Nevada
 CA
Elevation: 8070 ft
Aspect: NE
Specifics: We skied slope

Co-ord: 39.35103N, -120.36673W
Slope Angle: 17°
Wind Loading: no

Stability: PF: 30
Air Temperature: -9°C
Sky Cover: CLR
Precipitation: NO
Wind: W Light Breeze

Layer Notes:
 62-70cm: Unexpectedly hard layer
 62-70cm: Problematic layer

Notes: Cold, clear, calm day with W winds only noticeable at the ridge top of Andacite Peak. Our CT and TT observations revealed sudden planar failures at 16cm and 32 cm, and an anomalous layer between 62-70cm that was harder than the surrounding layers. All in all, the avalanche danger was considered low, as no significant whumping, cracking, or natural avalanches of any consequence were recognized.
