Co-ord:
Slope Angle: 35°
Wind Loading:

Stability:
Air Temperature:
Sky Cover: BKN
Precipitation: NO
Wind: NW Light Breeze

HS: 153
Layer Notes:
 146-124cm: Refrozen wet grains
 70-69.5cm: Friable crust
 69.5-67cm: Maybe old SH?
 56-0cm: Laminate of crusts

Notes: Well consolidated pack at present, this is some of the weakest snow on the hill. Majority of the pack is healing, expect FC to develop near surface. Biggest concern is to see the new storm snow coming in bonds with the old surfaces. Old SH layer found and produced some results, none propagating - sticks together when compacted. Unlikely to be found anywhere else on the hill, and unlikely to be triggered even with large Xe.
