

HS:200 **Layer Notes:**
140-135cm: Problematic layer

Elevation: 10778 ft
Aspect: 95°

Specifics: Collapsing, localized; Recent avalanche activity on similar slopes; Recent avalanche activity on different slopes; We skied slope

Notes: HS was deeper than 250 cms. Lot's of recent slab avalanche activity around this area, on all aspects (photos attached).

Faceted graupel layer at 135cms, hypothesized to be the weak layer responsible for the west facing slab avalanches on the aprons of Mt. Zimmer (a couple appeared to be on slope angles around 35 deg or slightly less).
