

Red Fir Snag-Far Left

Evan Salke

Central Sierra

03/04/2022 - 2:10pm

CA

Co-ord:

Elevation: 8250 ft

Slope Angle: 38°

Aspect: 350°

Wind Loading: yes

Specifics: Pit dug in a Ski Area

Stability:

Air Temperature: -3°C

Sky Cover: X

Precipitation: S-1

Wind: SW Moderate

HS:60

PF: 25

PS: 10

Layer Notes:

4-5cm: Bonding to crust

4-5cm: Problematic layer

5-12cm: Rounding

20-32cm: Consolidating well

**Notes:** Recent warm spring weather has greatly rounded grains on N aspects. Crusts have thickened as well from diurnal cycles. Only smooth shear was within 5 cm of new snow, which is bonding well to pre-storm surface crust (on sun exposed aspects). Rough shear (slab break in layer between the two main crusts).
