 140-0cm: hasty hardnes analysis <140
 140-0cm: Problematic layer

Notes: Did not find bottom of snowpack (over probe length - 300+). Rapid pit - mostly for stability assessment rather than data/trend info gathering. Hasty hardness analysis below 140 (Hamilton - wind/solar event interface). Temps primarily gathered to look for gradient near Hamilton layer to check for near-crust faceting. CTs and profile did not indicate the need for further stability tests.
