 Slope Angle: 33°
 Wind Loading:

Stability: Good
 Air Temperature: -5°C
 Sky Cover:
 Precipitation: S-1
 Wind:

HS:465
 Layer Notes:
 380-365cm: remnants of graupel
 340-338cm: ice
 340-338cm: Problematic layer

Notes: Amazing to find a southwest facing slope with this much dry snow and so few crusts at the end of March. HS was more than 465cm. I couldn't find the bottom with a 300cm probe. Propagation at 340cm after ECTX on the ice crust. I couldn't find signs of a major grain hand hardness change above the crust. Some ECTN's in the top 3' of the snow- not repeatable. Surface crust with NSF above is worth noting as we move forward.
