

Notes: Health checkup on the state of the near surface facets buried in the previous weeks storm. Found 15cm of 4F+ rounding facets (1.5mm) ~13cm deep. Strong in shear, but moderately weak in compression CTM11 PC. 4F melt forms found near the base of the snowpack plus penetrable MF crusts throughout indicates a warm snowpack. This will be promoting fast metamorphism meaning faster rounding of the facets.
